

How to stop Windows 10 from automatically applying upgrades to Windows 10

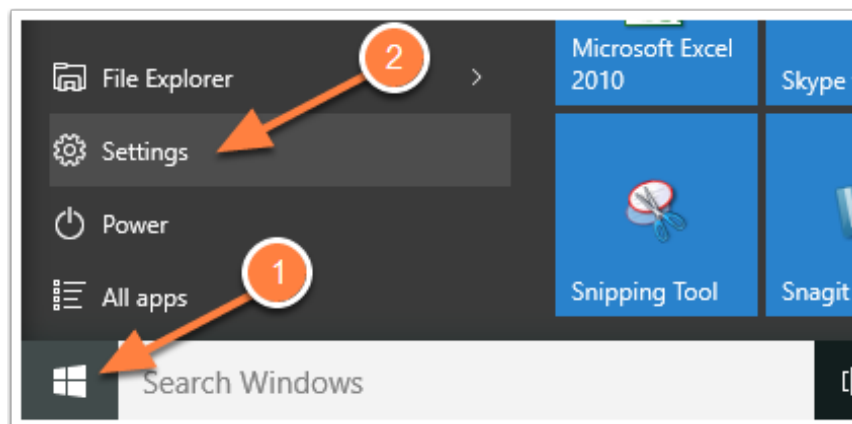

Stop Automatic Windows Upgrades

Sometimes Microsoft releases updates that are buggy. To avoid automatically applying future upgrades, follow the steps below.

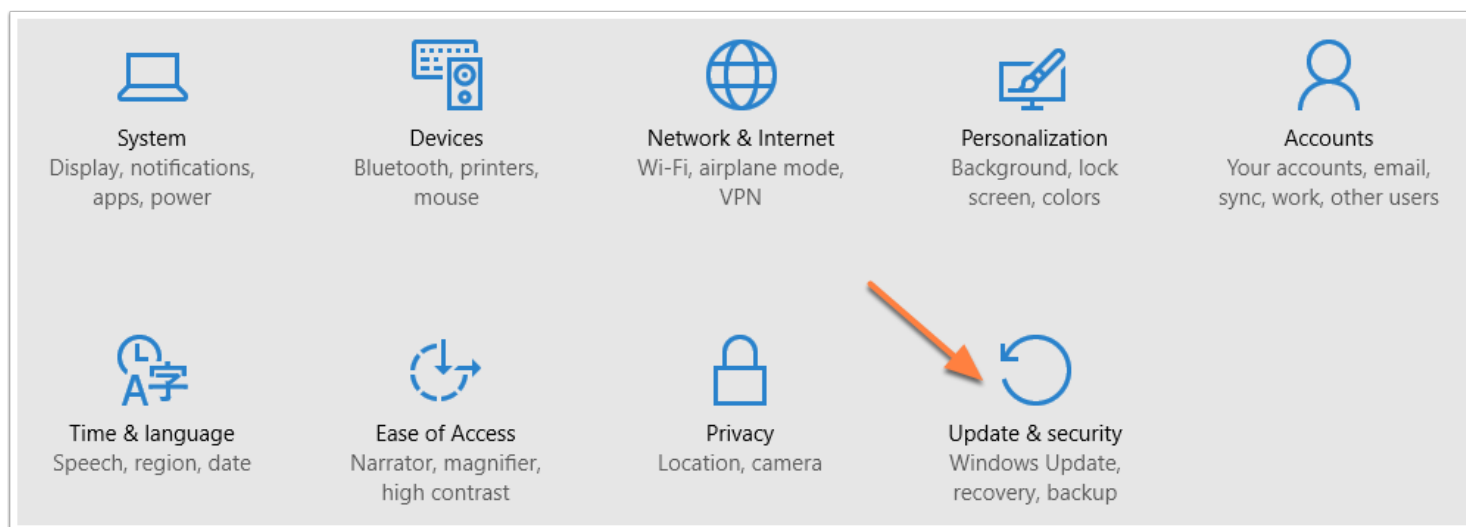

It is important to keep Windows and other software up-to-date to avoid damage from viruses and hackers that exploit security holes. A best practice is to use settings that do this automatically.

The steps below allow you to defer the downloading and installation of Windows upgrades while still automatically applying Windows Security updates.

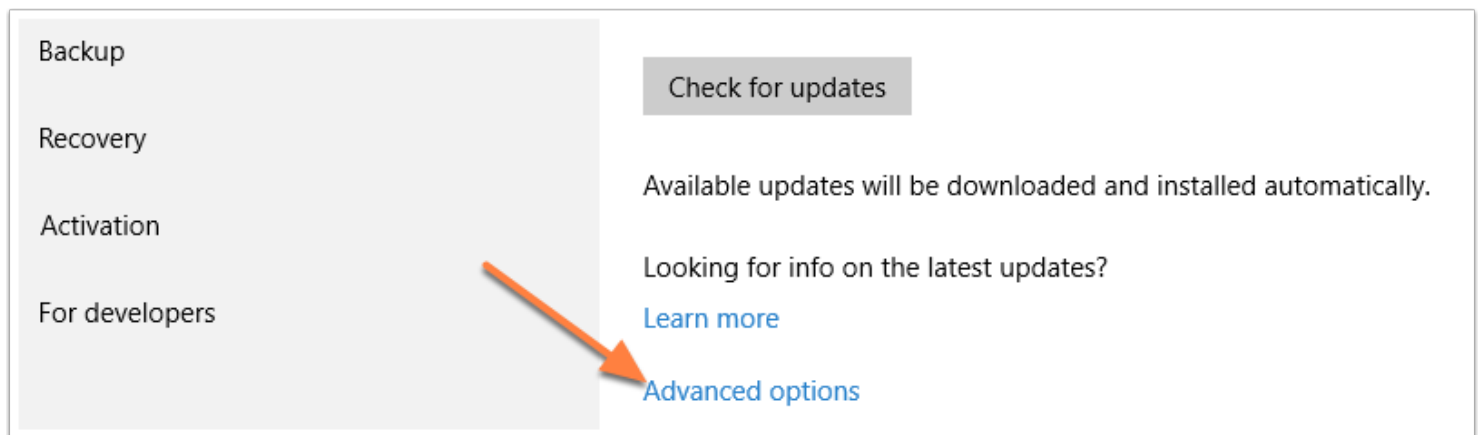

1. Click Start button
2. Click Settings

Click Update & Security

Click Advanced Options

Defer Upgrades

Instead of disabling Automatic updates, a better practice is to **Defer upgrades**. That will allow some time for bugs to be eliminated from Windows upgrades. Here is what Microsoft says about **Defer upgrades**:

Some Windows 10 editions let you defer upgrades to your PC. When you defer upgrades, new Windows features won't be downloaded or installed for several months. Deferring upgrades doesn't affect security updates. Note that deferring upgrades will prevent you from getting the latest Windows features as soon as they're available.

Choose how updates are installed

Automatic (recommended) ▾

Keep everything running smoothly. We'll restart your device automatically when you're not using it. Updates won't download over a metered connection (where charges may apply).

☒ Give me updates for other Microsoft products when I update Windows.
